

ISKOLARIS: Scholarship Journey App for De La Salle University Undergraduate Scholars

A Business Application Development Proposal Presented to
Department of Information Technology
College of Computer Studies
De La Salle University

In Partial Fulfillment of the Requirements in
ITISDEV: Business Applications Development

Prepared and Submitted By:
Ong, Kien Patrick Zharvy A.
Benito, Juan Carlos R.
Sanchez, Samantha Breanne A.

Dr. Raphael Gonda
Professor

Date Submitted
June 22, 2026

Proposal Outline

1. Executive Summary

Iskolaris is a web-based application where students can discover information regarding De La Salle University's scholarships offered by the **Admissions and Scholarships Office (AdSO)** and the **Department of Science and Technology (DOST)**. The application addresses the challenge of students having limited awareness of available scholarship opportunities, eligibility requirements, application procedures, benefits, and renewal processes. Additionally, Iskolaris serves as a scholarship management platform that supports scholarship verification, renewal submissions, appeal processing, stipend disbursement tracking, academic performance monitoring, budget management, and resume building. Through features such as GPA analytics, scholarship retention tracking, financial monitoring tools, and professional portfolio development, the application empowers students to effectively manage their academic, financial, and career growth throughout their university journey. The main stakeholders of this project are **DLSU scholars, the Finance & Accounting Office, Admissions and Scholarships Office, and the DOST Core Group under DLSU**. For the initial implementation, the system is limited to De La Salle University Manila and focuses specifically on scholarships administered by AdSO and DOST, with manual document verification and approval processes performed by authorized administrators.

2. Background and Context

Scholarships play a significant role in helping students achieve their educational goals by providing financial assistance. However, many students encounter difficulties in finding scholarships due to the lack of a centralized and accessible source of information. Scholarship details are often distributed across multiple websites, social media platforms, and official announcements, making it difficult for students to stay informed about available scholarships, eligibility requirements, and application deadlines.

De La Salle University offers merit-based scholarships, such as the **Star Scholars Program, Archer Achiever Scholarship, and Animo Grants Scholarship Program**, as well as financial assistance programs such as the **St. La Salle Financial Assistance Grant** (De La Salle University, 2026). In addition, many DLSU students benefit from the **Department of Science and Technology–Science Education Institute (DOST-SEI) Undergraduate Scholarship Program**, which provides financial support to qualified students pursuing priority programs in science, technology, engineering, and mathematics (STEM) fields (Science Scholarships | Science Education Institute, n.d.).

To address these challenges, Iskolaris is proposed as a web-based scholarship finder and tracker that consolidates scholarship information into a single, user-friendly platform. The system aims to improve students' access to scholarship opportunities and support them in effectively managing their applications. Iskolaris seeks to enhance the scholarship application experience and contribute to accessibility in education.

Stakeholders/Roles Table

Stakeholder/Role	Primary Responsibilities	Information Needs (Monitoring)
Students/Scholars	Submit renewal and appeal requirements, monitor academic performance, track stipends, manage budgets, and build resumes.	Scholarship opportunities, eligibility requirements, renewal schedules, scholarship status, GPA standing, stipend release updates, and appeal outcomes
Admissions and Scholarships Office (AdSO)	Verify scholar documents, review renewals and appeals, and maintain scholar records.	Pending applications, renewal submissions, appeal requests, and scholarship statuses
DOST Core Group under DLSU	Review scholar compliance, process renewals, appeals, and stipend monitoring.	Scholar eligibility, renewal compliance, GPA performance, appeal history, stipend distribution progress
Finance and Accounting Office (FAO)	Process and monitor scholarship grants and stipend disbursements	Stipend schedules, disbursement status, pending releases, and financial reports

Table 1. Stakeholders and Roles

Table 1 illustrates the key stakeholders involved in the Iskolaris system and their corresponding responsibilities and information needs. In order for scholars to effectively monitor their academic and scholarship status and for administrative units to effectively handle the processes of verification, renewal, appeals, and stipend disbursement, the system must provide role-based access to relevant information. The system's functional requirements and general design are based on this alignment between stakeholder roles and information needs.

SWOT Analysis

Strengths	Weaknesses	Opportunities	Threats
Centralized scholarship information reduces student confusion regarding	Dependence on manual verification may increase administrative workload and	Can be expanded to include external scholarships from other government agencies, NGOs,	Changes in scholarship policies or eligibility criteria may require frequent system updates.

scholarship requirements, benefits, and deadlines.	processing time.	and private organizations.	
Automated renewal, appeal, and stipend tracking improves transparency and reduces missed submissions.	System accuracy depends on timely updates from administrators and scholarship offices.	Integration with university systems such as ArchersHub could improve data accuracy and efficiency.	Data privacy and security risks associated with storing academic and financial information.
Academic performance analytics provide proactive support for scholarship retention and student success.	Initial implementation is limited to DLSU and DOST under DLSU.	Analytics can be used to identify at-risk scholars and support intervention programs.	Low user adoption may reduce the effectiveness and benefits of the platform.
Role-based access ensures that students and administrators receive relevant information and functionality.	Some processes remain dependent on human review, potentially causing delays during peak periods.	Can serve as a model for a university-wide or multi-institution scholarship management platform.	Technical failures, downtime, or loss of system data may disrupt scholarship operations.

Table 2. SWOT Analysis

The SWOT analysis indicates that Iskolaris possesses strong potential to improve scholarship management through centralized information access, streamlined renewal and appeals processes, academic performance monitoring, and stipend tracking. Although manual verification processes and dependence on administrative updates may have an impact on the system's effectiveness, these limitations are outweighed by opportunities to improve student support services, operational efficiency, and transparency.

3. Ishikawa Diagram

Ishikawa 1 — Root causes of no real-time visibility into scholarship and stipend status

Figure 1. Ishikawa Diagram – “No real-time visibility into scholarship and stipend status”

Figure 1 shows that the lack of real-time visibility into scholarship renewals and stipend disbursements is caused by a combination of people-, procedure-, policy-, technology-, and environment-related factors. From the *People* perspective, no specific employee is assigned to proactively inform scholars once their individual renewal requests or stipend releases have been processed. Instead, scholarship-related communication is commonly disseminated through broad **Help Desk Announcements (HDA) endorsed by the Admission of Scholarships Office (AdSO)**, which address the general DLSU scholar population rather than the concerns of specific individuals. As a result, scholars who require updates regarding their particular cases often need to initiate follow-ups themselves. From the *Procedures* perspective, scholars must manually verify their status through Archers Hub and independently determine whether a renewal has already been processed on their end. Furthermore, there is no standardized timeframe communicated for each stage of the renewal or appeal process, fostering uncertainty regarding when updates can reasonably be expected.

From the *Policy* and *Technology* perspectives, confirmation of scholarship renewal is often indirectly communicated through a record of a **Refund (RF) line item on the scholar's tuition assessment in Archers Hub in the current academic term**, rather than through a dedicated notification mechanism. This practice forces scholars to repeatedly check university systems in hopes of identifying status changes. Compounding this issue, Archers Hub updates may sometimes be delayed or outdated, causing discrepancies between the actual processing status and the information visible to scholars. Moreover, there is currently no dedicated integrated digital tool that automatically notifies scholars when tuition credits have been applied or stipends have been disbursed. Environmental factors further worsen the situation because renewal-related HDA emails frequently compete with numerous university-wide announcements distributed daily. Consequently, important scholarship updates can

become buried in crowded inboxes, reducing awareness and contributing to the overall lack of transparency. Together, these factors create an environment where scholars have limited visibility into critical scholarship-related developments, directly motivating Iskolaris' proposed notification and status-tracking capabilities.

Ishikawa 2 — Root causes of slow opaque scholarship renewal and appeal turnaround

Figure 2. Ishikawa Diagram – “Slow opaque scholarship renewal & appeal turnaround”

Figure 2 shows that delays in scholarship renewal and appeal processing stem from multiple operational constraints involving people, procedures, policies, technology, and environmental conditions. From the *People* perspective, renewal and appeal submissions are manually reviewed by staff from the **Admissions and Scholarships Office (AdSO) and the DOST Core Group under DLSU on a case-by-case basis**. Because reviews are conducted individually and manpower is limited, processing queues naturally accumulate, particularly during periods of high submission volume. Additionally, scholars' follow-up inquiries have been reported to be occasionally overlooked due to the large number of concerns handled by the involved offices. These conditions contribute to prolonged waiting periods and create the perception that submissions remain unacknowledged or unattended.

From the *procedural* perspective, renewal schedules may be extended to accommodate backlogs, causing scholars to wait longer for official decisions. For instance, the renewal schedule for this academic term (A.Y. 2025-2026, Term 3) was extended indefinitely until further notice since screening and crediting were still ongoing on AdSO's end. This is pursuant to the HDA released last May 23, 2026: *[AdSO] Updated - Renewal of Scholarships, Grants, and Discounts for Term 3, AY 2025-2026*. Moreover, cases that move between renewal and appeal stages also experience fragmented review processes because information is often handled through separate workflows.

On the other hand, *Policy*-related factors contribute further uncertainty, as stipend disbursement schedules are not always implemented according to their originally communicated timelines. In some instances, stipends expected to be released periodically throughout a term (e.g. monthly stipend

disbursement) are instead distributed as a **single consolidated grant**. *Technologically*, scholars lack access to a centralized status-monitoring system that indicates whether a submission has been received, acknowledged, reviewed, or finalized. Renewal and appeal processes are commonly managed through **separate Google Forms**, resulting in disconnected records and limited visibility across stages. Environmental conditions also intensify delays, as scholarship processing periods frequently coincide with other major university administrative activities such as enrollment, tuition payments, and registration periods. Collectively, these factors produce a renewal and appeal process that appears slow and opaque to scholars, reinforcing the need for Iskolaris' centralized workflow monitoring and status-tracking features.

Ishikawa 3 — Root causes of financial and academic strain on DLSU scholars

Figure 3. Ishikawa Diagram – “Financial and academic strain on DLSU scholars”

Figure 3 shows that the financial and academic challenges experienced by DLSU scholars are influenced by interconnected causes. From the *People* perspective, scholars are primarily responsible for monitoring their own retention requirements, including scholarship-specific **Term GPA (TGPA)**, **Cumulative GPA (CGPA)**, and other academic conditions. Because these requirements are often tracked manually, scholars may struggle to determine whether they remain eligible for renewal or are approaching probationary standing. From the *procedural* perspective, delays in scholarship renewal processing can have direct financial consequences, particularly for **partial scholars whose tuition discounts have not yet been credited**. In such situations, scholars may incur **surcharge fees** while waiting for administrative processing and may subsequently need to request fee waivers to address these additional costs.

From the *policy* perspective, scholarship retention requirements are commonly documented only within **scholarship contracts** and related paper-based materials. This limits accessibility and places the burden of compliance monitoring entirely on the scholar. Partial scholars are also frequently compelled to delay payment of their remaining balances until scholarship discounts have been officially credited to their

accounts. Technological limitations further exacerbate these issues because no integrated platform currently exists to monitor retention requirements, project academic standing, or notify scholars regarding expected stipend release timelines. Likewise, there are no built-in support mechanisms that guide scholars toward alternative financial resources or action plans when aid is delayed, suspended, or terminated. Environmental factors intensify the overall strain because scholarship renewal and stipend disbursement schedules often overlap with university tuition and fee deadlines. These overlapping timelines create compounded financial pressure, forcing scholars to manage academic obligations while simultaneously dealing with uncertainty regarding tuition assistance and stipend availability. Consequently, these combined factors contribute to the financial and academic burden that Iskolaris seeks to address through retention monitoring, academic analytics, financial tracking, and proactive notification features.

4. Solutions Framework

Figure 4: Solutions Framework

The proposed Solutions Framework for the Iskolaris web application is structured around **four (4) interconnected functional modules**, each engineered to address specific documented problems while capitalizing on identified opportunities for program enhancement. This ensures systematic coverage of the scholarship ecosystem—from registration and credential onboarding through term-specific compliance evaluations, multi-interval financial monitoring, and continuous academic risk mitigation—while maintaining a clear separation of responsibilities between system components.

The framework operates on a defined input-output model, consuming critical data elements including **student identity profiles**, **electronic Enrollment Assessment Forms (EAF)**, **official grade layouts**, and **multi-template proof of scholarship files**. It transforms these inputs through feature-rich modules into tangible, structured outputs comprising interactive

grade projection matrices, automated alert states, and standardized career documents. The architecture explicitly accommodates a multi-user ecosystem, implementing role-based access controls and customized interfaces tailored to the distinct administrative workflows of institutional evaluators (AdSO, FAO, USG-OTREAS, DOST Core Group) and the self-tracking behaviors of Lasallian scholars.

4.1 Scholar Onboarding and Access Management Module

Figure 5: Scholar Onboarding and Access Management Module

This module acts as the secure entryway for the application. It makes sure student accounts are real, prevents fake document submissions, and reduces the workload for administrators checking incoming paperwork. When a student registers, they **input their basic details and upload their official scholarship award letter**. The system then processes this entry using a two-tier access rule.

- **Core Logic & Operations**
 - **Conditional Access Gateway Router:** This automatically controls what a student can see based on their account status. While an admin is reviewing their application, the student is locked out of sensitive areas like the Renewal and Appeals tabs. However, they can immediately use helpful tools like Academic Tracking, the Budget Tracker, and the Resume Builder.

- **Manual Authentication & Inspection Desk:** This gives university administrators a single, clean workspace to review documents manually. Instead of using automated scanning software—which can easily misread files or fail to spot fakes—admins inspect the unique templates themselves and click "Approve" to unlock full system features for the student.

4.2 Scholarship Renewal, Evaluation, and Disbursement Module

Figure 6: Scholarship Renewal, Evaluation, and Disbursement Module

This module serves as the primary engine for managing active scholarships. It is built to fix administrative delays, replace messy broadcast emails that get lost in student inboxes, and show clear timelines for tuition credits and cash stipends. It replaces old Google Forms workflows with **automated deadline tracking and clear insight dashboards for school offices.**

- **Core Logic & Operations**

- **Schedule-Locked Renewal Facility:** This enforces strict deadlines. It opens up file upload areas for Enrollment Assessment Forms (EAF) and Grade View sheets from ArchersHub only during the university's official renewal period. Once a student submits their documents, the system

locks the window so changes cannot be made, and switches the status to "Submitted."

- **Intelligent Evaluation Insight Assistant:** This tool automatically reads submissions and gives quick, visual cues to reviewing offices. It marks grade eligibility with green or red colors, checks if the uploaded form layouts are correct, highlights how many times that student has appealed in the past, and reminds admins to double-check entries against ArchersHub to prevent errors from delayed data.
- **Indicative Lifecycle Status Tracker:** This displays real-time progress steps (Submitted, Acknowledged, Under Review, Processed) directly on the student's screen. It removes guessing games and prevents students from constantly needing to email or call offices for updates.
- **Interval Stipend Tracking Timeline Engine:** This builds a visual progress bar matching how a student receives their money. If a scholarship gives monthly pocket money, it shows a split, four-line segment timeline; if it is a one-time term grant, it displays a single continuous line. It sends automatic alerts the moment the FAO or DOST group marks the stipend as sent.

4.3 Academic Performance Analytics and Appeals Facility Module

Figure 7: Academic Performance Analytics and Appeals Facility Module

This module serves as a helpful warning system and a safety net for students. It replaces the practice of keeping track of strict scholarship terms on paper by giving students digital charts to monitor their status and a smooth, structured process to follow if they are placed on probation.

- **Core Logic & Operations**

- **Dual-Metric Performance Charting Engine:** This takes a student's term grades and displays a line graph of their Term GPA and Cumulative GPA. It superimposes these lines over a solid horizontal line that shows their minimum required retention grade. If their GPA dips too close to the line, the system flashes a visual warning.
- **Predictive Target Grade & Latin Honors Calculator:** This tool looks at how many units a student has finished vs. how many remain for their degree. Students can select a goal (like graduating Summa Cum Laude or hitting their scholarship's exact target) and the tool calculates the exact average grade they need to maintain in their remaining terms to achieve it.

- **Conditional Probationary Appeals Pipeline:** If a renewal review goes poorly and changes a student's status to "Probation," this tab automatically unlocks. It gives the student a clear checklist to upload their Letter of Reconsideration and official backup proofs (like medical certificates or college notes) so the review boards can look at everything via a single, simple form.
- **Dean's List Certificate Document Vault:** A localized, secure folder where students can safely upload, name, and archive their Dean's List certificates to build an official academic folder over time.

4.4 Personal Finance and Professional Development Value-Add Module

Figure 8: Personal Finance and Professional Development Value-Add Module

This module offers extra tools focused entirely on supporting the student's personal budget and helping them turn their hard work at school into career opportunities.

- **Core Logic & Operations**

- **Dual-Stream Income & Expense Ledger Facility:** This automatically syncs a student's approved scholarship stipends with an interactive money dashboard. Students can add their other income streams (like

parental allowance or part-time job pay) right next to their scholarship payouts to see all their money in one spot.

- **Daily Spending Dropdown & Cost Allocator:** A rapid expense entry tool split into clear student cost categories (food, transportation, dorm rent, school supplies). It automatically creates spending charts to show exactly where money is going and calculates how many days their cash will last before the next stipend arrives.
- **Academic Intersect Pipeline:** This background feature connects directly to the student's profile and document vault. It grabs their verified degree program information and verified Dean's List achievements, automatically typing them into the resume builder so the user doesn't have to input them manually.
- **Resume Layout Assembler & PDF Compiler:** This gathers the student's academic history, campus organization roles, and skill lists into a clean, single-page layout. The design is optimized to pass corporate resume screening software (Applicant Tracking Systems) and lets students download their ready-made resume as a PDF with a single click.

5. Scope of Work

The proposed application includes the following functions:

Function	Description
Scholar Registration and Verification	Allows students to register by providing personal and academic information, selecting their scholarship(s), and uploading proof of scholarship for manual verification and approval by administrators.
Scholarship Renewal	Allows scholars to submit renewal requirements, such as the Enrollment Assessment Form and the previous term grades, during designated renewal periods. Administrators can review submissions and update scholarship status as renewed, probationary, or terminated.
Scholarship Appeal	Provides a portal for probationary scholars to submit appeal letters and supporting documents for manual review and approval by scholarship administrators.

Stipend Disbursement Tracking	Allows scholars to monitor stipend releases through timeline-based tracking and receive notifications regarding disbursement status updates.
Academic Performance Tracking	Tracks Term GPA and Cumulative GPA, provides academic analytics, scholarship retention monitoring, Latin Honors projections, and Dean's List certificate management
Budget Tracking	Enables scholars to record income sources, stipends, allowances, and daily expenses to support personal financial management and budgeting.
Resume Builder	Provides a structured platform for creating professional resumes using academic records, verified achievements, leadership experiences, and skills, with PDF export functionality.
Notification System	Sends reminders and updates regarding scholarship applications, renewal schedules, appeal outcomes, stipend releases, and other scholarship-related activities.
Administrator Dashboard	Allows AdSO, DOST Core Group under DLSU, and other authorized administrators to review scholar registrations, renewal requests, appeals, stipend statuses, and generate reports for decision-making.
Document Management	Provides secure storage and management of scholarship documents, renewal requirements, appeal documents, and academic certificates uploaded by scholars.

6. Business Process Model and Notation (BPMN)

6.1 Scholar Registration/Verification Process

Figure 9: Scholar Registration/Verification Process

The Scholar Registration/Verification workflow maps out the initial secure pipeline for onboarding an applicant through three **(3) distinct operational lanes (Scholar, Iskolaris, and AdSO/DOST Core Group)**, beginning when a student signs up, fills in personal and academic details, selects their active scholarships, and uploads an **official award letter as proof of scholarship**. Upon submission, the Iskolaris system acts as an automated broker that creates a restricted pending account, archives the verification files in secure data tables, and triggers an administrative notification to the AdSO/DOST Core Group review workspace. The process then hits an evaluation gateway where administrators manually inspect the physical files; if rejected, the application is terminated, but if approved, the administrator activates full scholar system access and triggers an automated confirmation email to conclude the onboarding process.

6.2 Scholarship Renewal

Figure 10: Scholarship Renewal

The Scholarship Renewal process outlines a termly compliance evaluation tracking cycle designed to assess a student's ongoing contract eligibility, initiated when a student receives an automated renewal window notification and uploads their **electronic Enrollment Assessment Form (EAF) for the current academic term** and official **previous academic term grades from ArchersHub**. Once the scholar submits the request, the Iskolaris backend locks the submission workspace to prevent changes, validates the document layouts, and automatically compiles intelligent evaluation insights such as grade eligibility flags and historical student appeal logs before forwarding the complete package to the review queue. The AdSO/DOST Core Group then checks the raw documentation alongside the system-generated metrics to route the student profile through a three-way decision gateway—either updating the status to **"Renewed"** to open the companion stipend disbursement facility, transitioning the account to **"Probation"** with an automated reminder to access the appeals tab, or selecting **"Terminated"** if grade or contract requirements are completely missed—with all three results triggering a final notification dispatch to the user.

6.3 Scholarship Appeal

Figure 11: Scholarship Appeal

The Scholarship Appeal workflow serves as an administrative safety net that allows a student placed on probationary status to request a formal review, beginning when the user opens their dedicated Appeal Facility to upload a formal **Letter of Reconsideration** alongside **official supporting documents such as medical certificates, laboratory results, death certificates, or college endorsements**. The Iskolaris platform stores the submitted appeal package in secure data files and forwards the dashboard entry to the AdSO/DOST Core Group lane for manual administrative evaluation. The review team evaluates the contextual parameters and processes the profile through an **"Appeal Approved?"** decision gate: a positive resolution overrides the probation to mark the specific scholarship as renewed, while a negative resolution results in a permanent scholarship termination, with both paths executing an automated update email to the user before ending the process.

6.4 Stipend Disbursement

Figure 12: Stipend Disbursement

The Stipend Disbursement process coordinates the internal scheduling, milestone updates, and visual tracking of financial allowances after a student successfully achieves a renewed scholarship status. The workflow initializes when an official in the **FAO/DOST Core Group** lane manually updates a student's stipend payment status inside their ledger at a given term or monthly interval depending on the specific nature of the scholarship contract. The Iskolaris engine automatically catches this data change, updates the student database tables to advance the interactive disbursement timeline, and dispatches an automated notification email to the scholar, allowing them to log in, track their fund history, and view the updated progress segments directly on their dashboard viewport.

6.5 Academic Performance Tracking

Figure 13: Academic Performance Tracking

The Academic Performance Tracking workflow automatically triggers when a user opens their dashboard, prompting the Iskolaris backend to calculate the student's **Term GPA and Cumulative GPA**, cross-reference the scores against specific retention parameters, and evaluate the status through a threshold gateway. If the student's metrics fall below the scholarship's contract requirements, an **"At Risk"** warning banner displays prominently on the interface. If they remain in good standing, the system displays a validation badge, unlocks a target grade calculator to compute the exact averages needed in remaining units for selected Latin Honors or retention targets, and provides a secure portal to upload and save **Dean's List certificates** within their permanent academic portfolio.

6.6 Budget Tracking Processes

Figure 14: Budget Tracking Processes

The Budget Tracking workflow provides a **self-service personal finance system** by enabling the scholar to manually log custom income sources (such as parental allowances or part-time job pay) alongside automated scholarship stipend data. The user then records daily out-of-pocket costs, which the Iskolaris backend captures, stores in database records, and passes through a categorizing algorithm via an interactive dropdown filter to sort items into cost segments like food, commute, or dorm rent. The system processes these computed cash flows to construct visual charts, displaying a detailed category distribution pie chart and budget timeline graph directly on the user's viewport to forecast financial runways before the next stipend arrival.

6.7 Resume Builder Process

Figure 15: Resume Builder Process

The Resume Builder workflow maps out an automated portfolio generation engine designed to programmatically convert an active scholar's institutional milestones directly into career assets. The process begins when the user triggers the **"Open**

Resume Builder" event, commanding the Iskolaris platform to programmatically fetch verified profile data to **auto-fill foundational educational details (such as degree program and college)** while **simultaneously scanning the academic tracking module** to pull approved Dean's List and scholarship distinctions directly into the form. The scholar reviews these pre-populated fields, inputs custom text parameters to capture campus involvements, leadership roles, and core skill competencies, examines a real-time layout preview on their screen, and executes the **"Export to PDF"** function to generate an ATS-optimized corporate resume document.
